

Easy-To-Use Satellite Numbers

Route local phone numbers to your satellite phone

What is SatCollect?

SatCollect is a unique solution to allow satellite phone users to select one or many local phone numbers in over 50 different countries that will transparently route to their satellite phone. This results in a saving of up to 90% on call costs when compared to dialling the satellite phone number directly.

Simplify the calling process to a satellite phone

Knowing the country code or the long satellite phone number can create confusion, delays or can discourage calls to a satellite phone. Providing a service similar to what people are comfortable with will encourage more usage.

Enhanced cost saving features

In addition to the easier usage, you can also control your satellite budget with a simple permanent rate. In simple terms, you will pay calls on a "local to local" as opposed to "long distance to long distance" basis. Also, anyone calling to a satellite phone will no longer be charged for international rates. You can stop all unauthorized calls with pin based access codes and save money by routing the call over the SatCollect global network to a satellite phone wherever in the world it may be.

Easy To Use

- 1 Choose your country/area code.
- 2 Enter your sat phone number.
- 3 Use your new number and save.

Easy as 123.

Save Money

You can save up to 90% on per minute rates! Plus, fleet broadband customers get FREE local numbers in the US and Canada.

Adaptability & Flexibility

Supporting all major carriers, receive the flexibility required to meet the demands of today.
